

The key learning points are:

1. CyberArk Endpoint Privilege Manager (EPM) solution enables users to complete tasks requiring elevated permissions, without the need for full administrator access.
2. EPM supports our Cyber Defence teams by aligning with the zero-trust principle.
3. EPM lowers the chance of malware infections by eliminating the need for full administrative access on the device.
4. Standing privileged access granted full administrative access all the time. EPM is used as a market standard solution to provide the necessary elevated permissions at the right time to achieve the same outcome.
5. When using EPM, user access and permissions are managed through Personas, a logical grouping that defines a user's role and associated applications.
6. Each Persona is associated with specific responsibilities that define the scope of access and actions permitted for users within that Persona.
7. All access to an existing Persona will need to be approved by the Persona owner!
8. Users can submit a request through the EPM catalog in ServiceNow to initiate the necessary actions.
9. All users that have elevated permissions must participate in the attestation process every 6 months to confirm the need to have continued access to these elevated permissions.
10. An attestation request initiated through an email
11. If an elevated permissions are no longer needed, then simply choose to surrender. The elevated permissions will be removed, and the device will need to be re-enrolled.
12. If no response is received from user or user's Line Manager, access will be revoked.

13. To stay compliant and secure, follow these best practices when working with EPM.
- Ensure that your computer is on the network regularly so that the Cyber Defence team can scan and report your computer for any vulnerabilities.
 - Carry out remediation activities when vulnerability reports are shared by the Vulnerability Management Team or stakeholders from their respective businesses.
 - Follow best practices related to patch compliance, computer upkeep and unapproved software.
 - Read the End User License Agreement (EULA) prior to installation to ensure it is allowed to be used in a corporate environment and adhere to the licensing agreement.
